## MVO Weekly Report for the Period 12 November to 19 November 2021

Activity at the Soufrière Hills Volcano remains low.

The seismic network recorded seven volcano tectonic earthquakes this week.

SO<sub>2</sub> flux measurements were taken by helicopter on 12 and 16 November. The average flux values were 343 tonnes per day on the 12 November from ten traverses and 307 tonnes per day on 16 November from ten traverses.

Due to the large size of the lava dome, pyroclastic flows can occur at any time without warning on any side of the volcano, including Gages from where they can travel rapidly into Plymouth. Tracks across the Belham Valley can be destroyed or heavily modified by flash flooding or lahars, and caution should be exercised crossing the valley during and after rainfall.

The Hazard Level is 1. There is no public access to Zone V, including Plymouth. Maritime Zones E and W are daytime transit only between sunrise and sunset (boats may sail through the zone but must not stop). Anyone who ignores these restrictions is liable to be prosecuted.

This report along with additional information on the Soufrière Hills Volcano and the Hazard Level System can be found at the MVO website: [www.mvo.ms](http://www.mvo.ms). Old weekly reports can be downloaded from [http://www.mvo.ms/pub/Activity\\_Reports/](http://www.mvo.ms/pub/Activity_Reports/). You can also follow @mvoms on both Facebook and Twitter.

**Monitoring Data Summary**

**Seismic Activity (number of events)**

	This week	Last week	Last 4 weeks (weekly average)
Rockfalls	0	1	1
VT earthquakes	7	9	8
Hybrid earthquakes	0	0	0
LP earthquakes	0	0	0

**Sulphur Dioxide Flux (tonnes per day)**

	This week	Last week	Last 4 weeks
Average	325	293	375
Maximum	571	348	473
Minimum	201	230	254

*Note: The numbers provided in the tables above are provisional and may be subject to change after further analysis of the data.*
