MVO Weekly Report for the Period 15 to 22 July 2022

Activity at the Soufrière Hills Volcano remains low.

The seismic network recorded 16 volcano tectonic earthquakes this week.

SO₂ flux measurements were taken by boat on 15 and 20 July and by helicopter on 21 July. The average flux values were 481 tonnes per day on 15 July from 12 traverses, 661 tonnes per day on 20 July from 12 traverses and 616 tonnes per day on 21 July from 12 traverses.

Due to the large size of the lava dome, pyroclastic flows can occur at any time without warning on any side of the volcano, including Gages from where they can travel rapidly into Plymouth. Tracks across the Belham Valley can be destroyed or heavily modified by flash flooding or lahars, and caution should be exercised crossing the valley during and after rainfall.

The Hazard Level is 1. There is no public access to Zone V, including Plymouth. Maritime Zones E and W are daytime transit only between sunrise and sunset (boats may sail through the zone but must not stop). Anyone who ignores these restrictions is liable to be prosecuted.

This report along with additional information on the Soufrière Hills Volcano and the Hazard Level System can be found at the MVO website: www.mvo.ms. Old weekly reports can be downloaded from http://www.mvo.ms/pub/Activity_Reports/. You can also follow @mvoms on both Facebook, Instagram, and Twitter.

MVO Weekly Report for the Period 15 to 22 July 2022

Monitoring Data Summary

Seismic Activity (number of events)

	This week	Last week	Last 4 weeks (weekly average)
Rockfalls	0	0	0
VT earthquakes	16	14	10
Hybrid earthquakes	0	0	0
LP earthquakes	0	0	0

Sulphur Dioxide Flux (tonnes per day)

	This week	Last week	Last 4 weeks
Average	586	475	525
Maximum	997	1318	1211
Minimum	409	224	197

Note: The numbers provided in the tables above are provisional and may be subject to change after further analysis of the data.
