MVO Weekly Report for the Period 16 to 23 August 2024

Activity at the Soufrière Hills Volcano remains low.

The seismic network recorded 12 volcano tectonic earthquakes, one hybrid earthquake, one long period earthquake and five rockfalls this week.

Measurements of the SO₂ flux were taken from the helicopter on 21 August. There were 12 traverses with an average flux of 123 tonnes per day.

Due to the large size of the lava dome, pyroclastic flows can occur at any time without warning on any side of the volcano, including Gages from where they can travel rapidly into Plymouth. Tracks across the Belham Valley can be destroyed or heavily modified by flash flooding or lahars, and caution should be exercised crossing the valley during and after rainfall.

The Hazard Level is 1. There is no public access to Zone V, including Plymouth. Maritime Zones E and W are daytime transit only between sunrise and sunset (boats may sail through the zone but must not stop). Anyone who ignores these restrictions is liable to be prosecuted.

This report along with additional information on the Soufrière Hills Volcano and the Hazard Level System can be found at the MVO website: www.mvo.ms. Old weekly reports can be downloaded from http://www.mvo.ms/pub/Activity_Reports/. You can also follow @mvoms on both Facebook, Instagram, and Twitter.

MVO Weekly Report for the Period 16 to 23 August 2024

Monitoring Data Summary

Seismic Activity (number of events)

	This week	Last week	Last 4 weeks (weekly average)
Rockfalls	5	0	1
VT earthquakes	12	7	8
Hybrid earthquakes	1	0	0
LP earthquakes	1	0	0

Sulphur Dioxide Flux (tonnes per day)

	This week	Last week	Last 4 weeks
Average	123	190	203
Maximum	155	215	278
Minimum	99	157	148

Note: The numbers provided in the tables above are provisional and may be subject to change after further analysis of the data.
